min/max - Heap \Rightarrow Min-Max-Heap.

Double Ended Priority Queue (Deap)

Data Structures and Algorithms
Undergraduate course

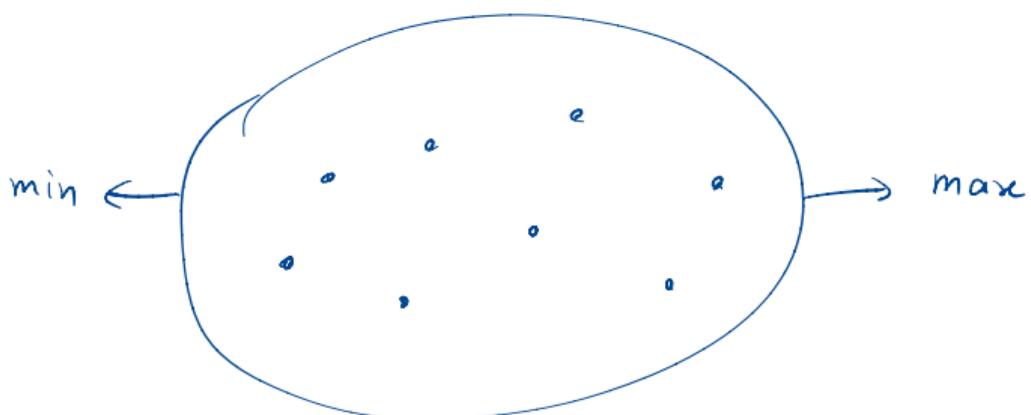

Mohammad GANJTABESH

University of Tehran

Motivations

- Access \min and \max in constant time
- Adjustment of order $O(\log_2 n)$.

Operations and Naive Implementations

Min , Max , Add , RemoveMin ,
RemoveMax , and other methods
for adjustment.

{
 Array
 Sorted Array
 Linked List
 Sorted Linked List

Tree Implementation: Properties

- Deaps : {
- has a heap structure (Complete Binary Tree)
 - root is always empty. Storing in array is appropriate
 - root's left(right) subtree is a min-heap (max-heap)
 - each node in left subtree is smaller than its correspondence in right subtree.
 - Access to the min and max is in constant time
 - Much more simpler and easier to maintain than the Min-Max-Heap.

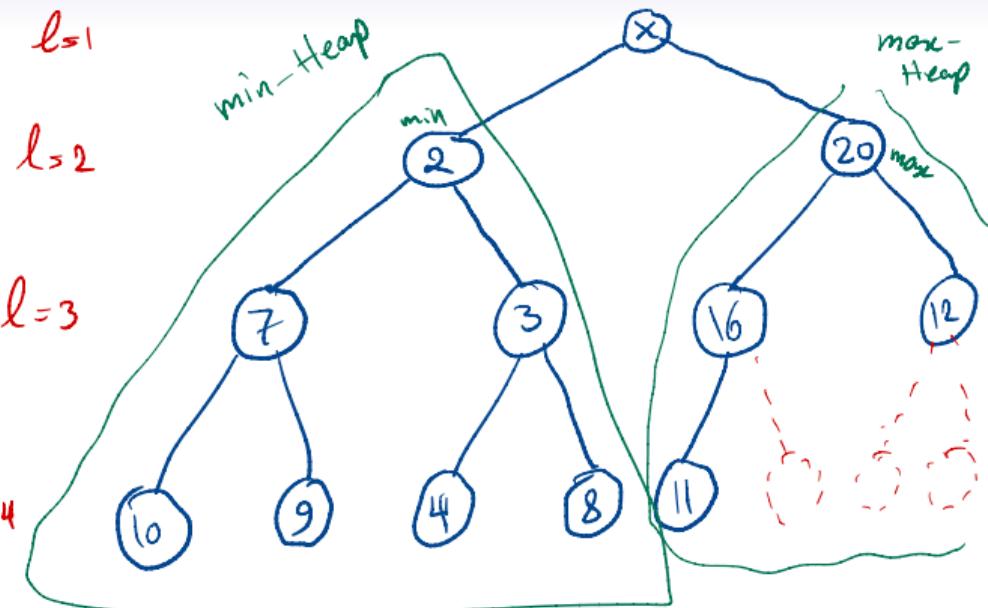

Example :

$$\text{Level}(i) = \lfloor \log_2 i \rfloor + 1$$

element in level l
 $= 2^{l-1}$

$\text{corr}(x) = \begin{cases} x + 2^{l-2} & \text{if } x \in \text{left subtree} \\ \frac{x}{2} + 2^{l-3} & \text{o.w.} \end{cases}$

$\text{corr}(y) = y - 2^{l-2}$
 $y \in \text{right subtree}$

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
x	2	20	7	3	16	12	10	9	4	8	11			

Tree Implementation

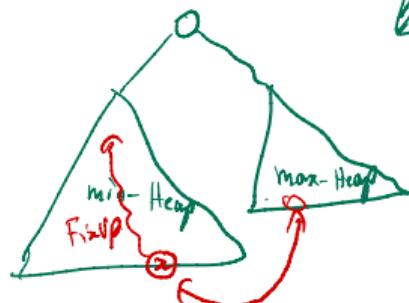

Min $\rightsquigarrow H[2]$ is the minimum.

Max $\rightsquigarrow H[3]$ is the maximum.

Add(x) $\rightsquigarrow \left\{ \begin{array}{l} \text{- Append } x \text{ to the end of array } H. \\ \text{- Swap } (x, \text{corr}(x)) \text{ if necessary.} \end{array} \right.$

Add(x) $\rightsquigarrow \left\{ \begin{array}{l} \text{- Append } x \text{ to the end of array } H. \\ \text{- Swap } (x, \text{corr}(x)) \text{ if necessary.} \\ \text{- FixUp } (x) \text{ in the corresponding subtree} \end{array} \right.$

where x belongs to .

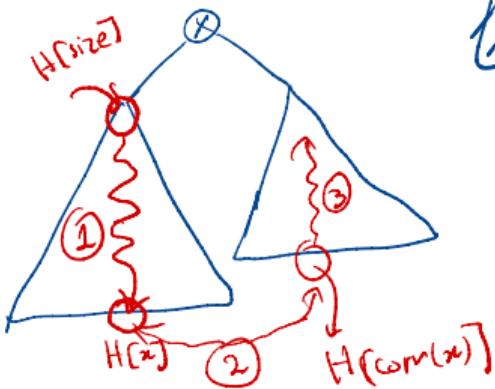

Tree Implementation

Remove Min $\rightarrow \left\{ \begin{array}{l} - \text{swap}(H[2], H[\text{size}]) \\ - \text{FixDown}(2) \text{ in the left sub tree} \\ - \text{swap}(H[x], H[\text{corr}(x)]) \text{ if necessary} \end{array} \right.$

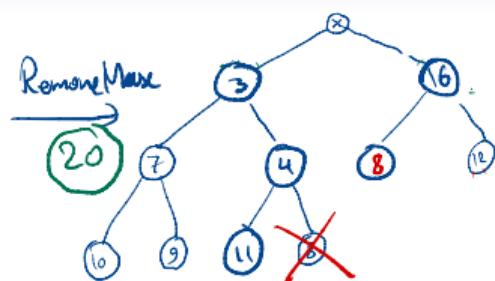

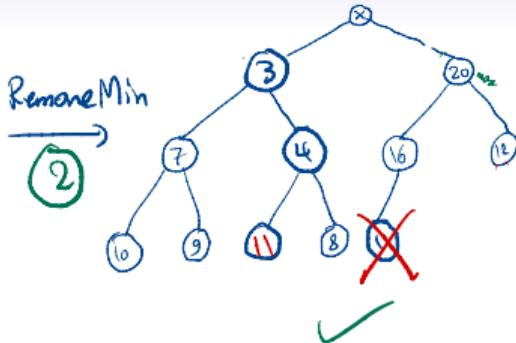

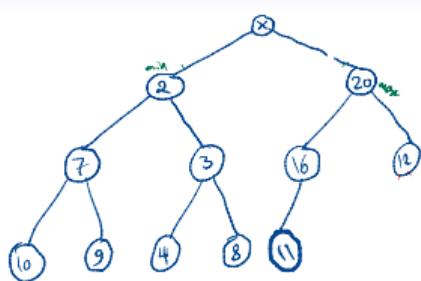

and perform
final position of
 $H[\text{size}]$ after
FixDown.

Fix Up on
the right
sub tree.

Remove Max $\rightarrow \left\{ \begin{array}{l} - \text{swap}(H[3], H[\text{size}]) \\ - \text{FixDown}(3) \text{ in the right sub tree} \\ - \text{swap}(H[x], H[\text{corr}(x)]) \text{ if necessary and perform FixUp} \end{array} \right.$

Example :

Add (1)
